FTS in PostgreSQL

- FTS is a powerful built-in text search engine
- No new features since 2006 !
- Popular complaints:
  - Slow ranking
  - No phrase search
  - No efficient alternate ranking
  - Working with dictionaries is tricky
  - Dictionaries are stored in the backend memory
  - FTS is flexible, but not enough

FTS in PostgreSQL

- **tsvector** – data type for document optimized for search
- **tsquery** – textual data type for rich query language
- **Full text search operator:** tsvector @@ tsquery
- **SQL interface** to FTS objects (CREATE, ALTER)
  - Configuration: {tokens, {dictionaries}}
  - Parser: {tokens}
  - Dictionary: tokens → lexeme{s}
- **Additional functions and operators**
- **Indexes**: GiST, GIN, RUM

```
to_tsvector('english','a fat cat sat on a mat and ate a fat rat')
                              @@
to_tsquery('english','(cats | rat) & ate & !mice');
```

http://www.postgresql.org/docs/current/static/textsearch.html

Some FTS problems: #1

156676 Wikipedia articles:

- Search is fast, ranking is slow.

```
SELECT docid, ts_rank(text_vector, to_tsquery('english', 'title')) AS rank
FROM ti2
WHERE text_vector @@ to_tsquery('english', 'title')
ORDER BY rank DESC
LIMIT 3;
```

```
 Limit (actual time=476.106..476.107 rows=3 loops=1)
   Buffers: shared hit=149804 read=87416
   ->  Sort (actual time=476.104..476.104 rows=3 loops=1)
         Sort Key: (ts_rank(text_vector, '''titl'''::tsquery)) DESC
         Sort Method: top-N heapsort  Memory: 25kB
         Buffers: shared hit=149804 read=87416
         ->  Bitmap Heap Scan on ti2 (actual time=6.894..469.215 rows=47855 loops=1)
               Recheck Cond: (text_vector @@ '''titl'''::tsquery)
               Heap Blocks: exact=4913
               Buffers: shared hit=149804 read=87416
               ->  Bitmap Index Scan on ti2_index (actual time=6.117..6.117 rows=47855 loops
                     Index Cond: (text_vector @@ '''titl'''::tsquery)
                     Buffers: shared hit=1 read=12
 Planning time: 0.255 ms
 Execution time: 476.171 ms
(15 rows)
```

Some FTS problems: #2

- No phrase search
  - “A & B” is equivalent to “B & A»
    There are only 92 posts in -hackers with person 'Tom Good', but FTS finds 34039 posts
  - FTS + regex is slow and can be used only for simple queries.

Some FTS problems: #3

- Slow FTS with ordering by timestamp («fresh» results)

```
SELECT sent,  subject from pglist
WHERE fts @@ to_tsquery('english', 'server & crashed')
 and sent < '2000-01-01'::timestamp
ORDER BY sent desc
LIMIT 5;
```

  - Bitmap index scan by GIN (fts)
  - Bitmap index scan by Btree (date)
  - BitmapAND
  - Bitmap Heap scan
  - Sort
  - Limit
  - 10 ms

No positions in index !

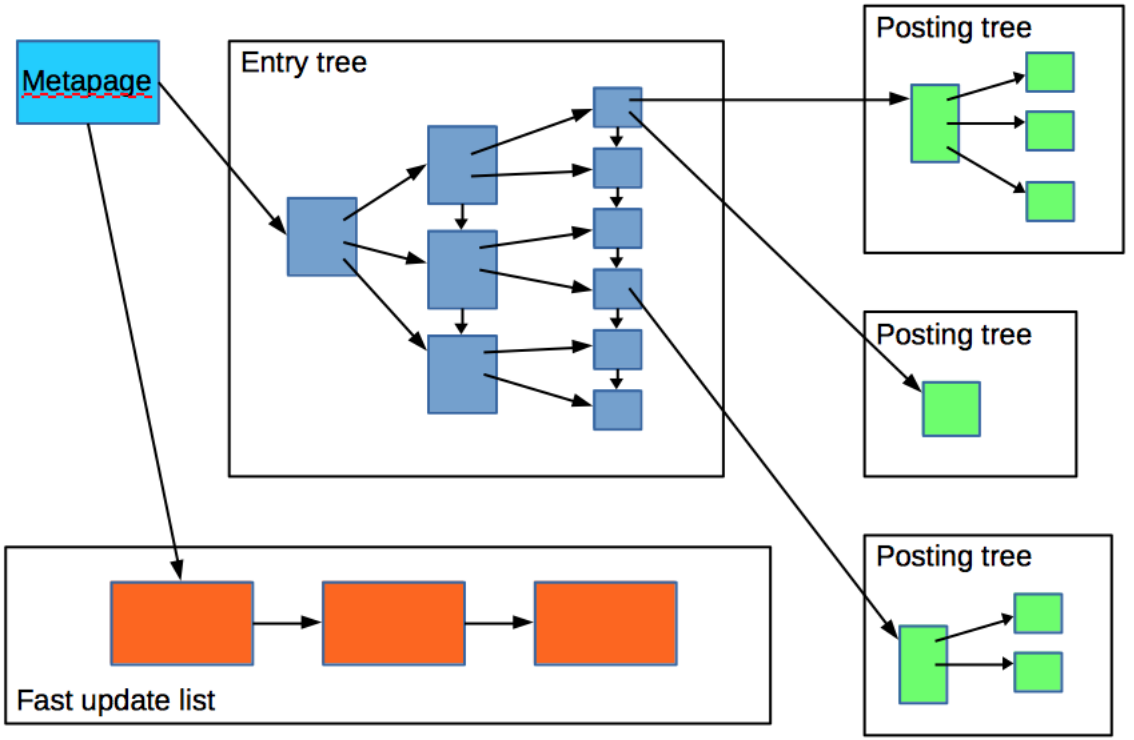
Improving GIN

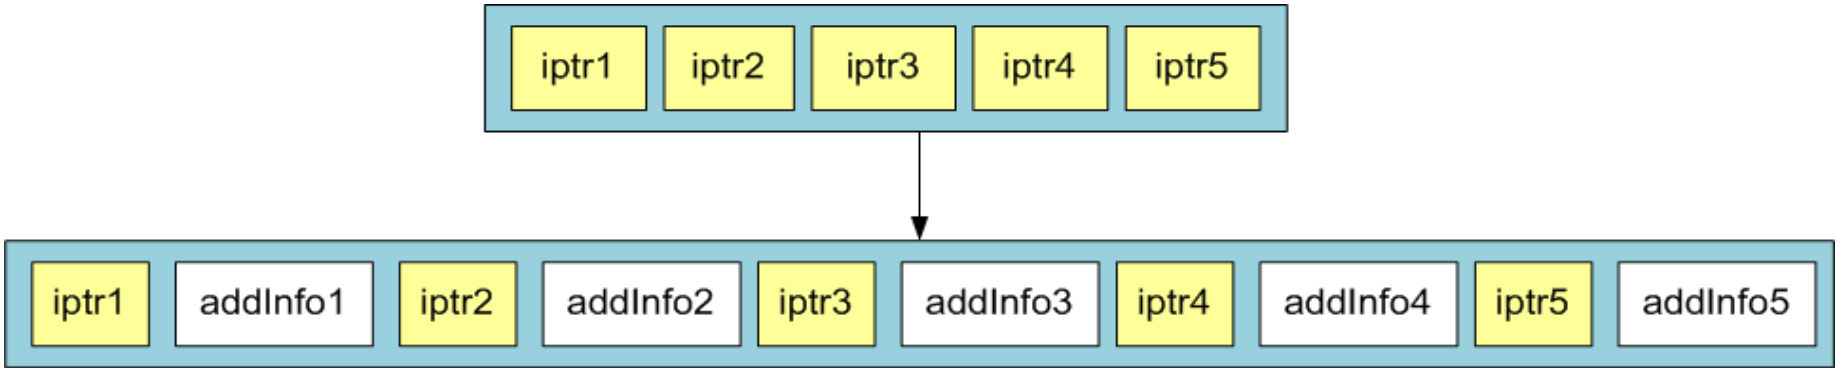
- Improve GIN index
  - Store additional information in posting tree, for example, lexemes positions or timestamps
  - Use this information to order results

Improving GIN



9.6: CREATE AM
GENERIC WAL

Create access methods
RUM as extension !



CREATE INDEX ... USING RUM

- Use positions to calculate rank and order results
- Introduce distance operator tsvector <=> tsquery

```
CREATE INDEX ti2_rum_fts_idx ON ti2 USING rum(text_vector rum_tsvector_ops);

SELECT docid, ts_rank(text_vector, to_tsquery('english', 'title')) AS rank
FROM ti2
WHERE text_vector @@ to_tsquery('english', 'title')
ORDER BY
text_vector <=> plainto_tsquery('english','title') LIMIT 3;
                                        QUERY PLAN
-----------------------------------------------------------------------------------------
 L Limit (actual time=54.676..54.735 rows=3 loops=1)
   Buffers: shared hit=355
   ->  Index Scan using ti2_rum_fts_idx on ti2 (actual time=54.675..54.733 rows=3 loops=1)
         Index Cond: (text_vector @@ '''titl'''::tsquery)
         Order By: (text_vector <=> '''titl'''::tsquery)
         Buffers: shared hit=355
 Planning time: 0.225 ms
 Execution time: 54.775 ms vs 476 ms !
(8 rows)
```

CREATE INDEX ... USING RUM

- Top-10 (out of 222813) postings with «Tom Lane»
  - GIN index — 1374.772 ms

```
SELECT subject, ts_rank(fts,plainto_tsquery('english', 'tom lane')) AS rank
FROM pglist WHERE fts @@ plainto_tsquery('english', 'tom lane')
ORDER BY rank DESC LIMIT 10;
                                                        QUERY PLAN

(10 rows)
```

Phrase Search (8 years old!)

- Queries 'A & B'::tsquery and 'B & A'::tsquery produce the same result
- Phrase search - preserve order of words in a query

  Results for queries 'A & B' and 'B & A' should be different !
- Introduce new FOLLOWED BY (<->) operator:
  - Guarantee an order of operands
  - Distance between operands

a <n> b == a & b & (∃ i,j : pos(b)i – pos(a)j = n)

Phrase search - definition

- FOLLOWED BY operator returns:
  - false
  - true and array of positions of the **right** operand, which satisfy distance condition
- FOLLOWED BY operator requires positions

```
select 'a b c'::tsvector @@ 'a <-> b'::tsquery; – false, there no positions
 ?column?
----------
 f
(1 row)
select 'a:1 b:2 c'::tsvector @@ 'a <-> b'::tsquery;
 ?column?
----------
 t
(1 row)
```

Phrase search - properties

- 'A <-> B' = 'A<1>B'
- 'A <0> B' matches the word with two different forms (infinitives)

```
=# SELECT ts_lexize('ispell','bookings');
   ts_lexize
----------------
 {booking,book}
to_tsvector('bookings') @@ 'booking <0> book'::tsquery
```

Phrase search - properties

- Precendence of tsquery operators - '! <-> & |'
  Use parenthesis to control nesting in tsquery

```
select 'a & b <-> c'::tsquery;
      tsquery
--------------------
 'a' & 'b' <-> 'c'

select 'b <-> c & a'::tsquery;
      tsquery
--------------------
 'b' <-> 'c' & 'a'

 select 'b <-> (c & a)'::tsquery;
           tsquery
----------------------------
 'b' <-> 'c' & 'b' <-> 'a'
```

Phrase search - example

- `TSQUERY phraseto_tsquery([CFG,] TEXT)`

  Stop words are taken into account.

```
select phraseto_tsquery('PostgreSQL can be extended by the user in many ways');
                    phraseto_tsquery
-----------------------------------------------------------
 'postgresql' <3> 'extend' <3> 'user' <2> 'mani' <-> 'way'
(1 row)
```

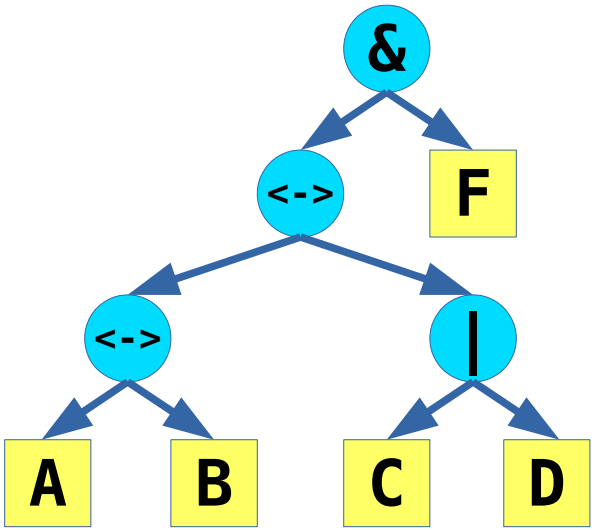
- `It's possible to combine tsquery's`

```
select phraseto_tsquery('PostgreSQL can be extended by the user in many ways') ||
                    to_tsquery('oho<->ho & ik');
                                  ?column?
-------------------------------------------------------------------------------
 'postgresql' <3> 'extend' <3> 'user' <2> 'mani' <-> 'way' | 'oho' <-> 'ho' & 'ik'
(1 row)
```

Phrase search - internals

- Phrase search has overhead, since it requires access and operations on posting lists

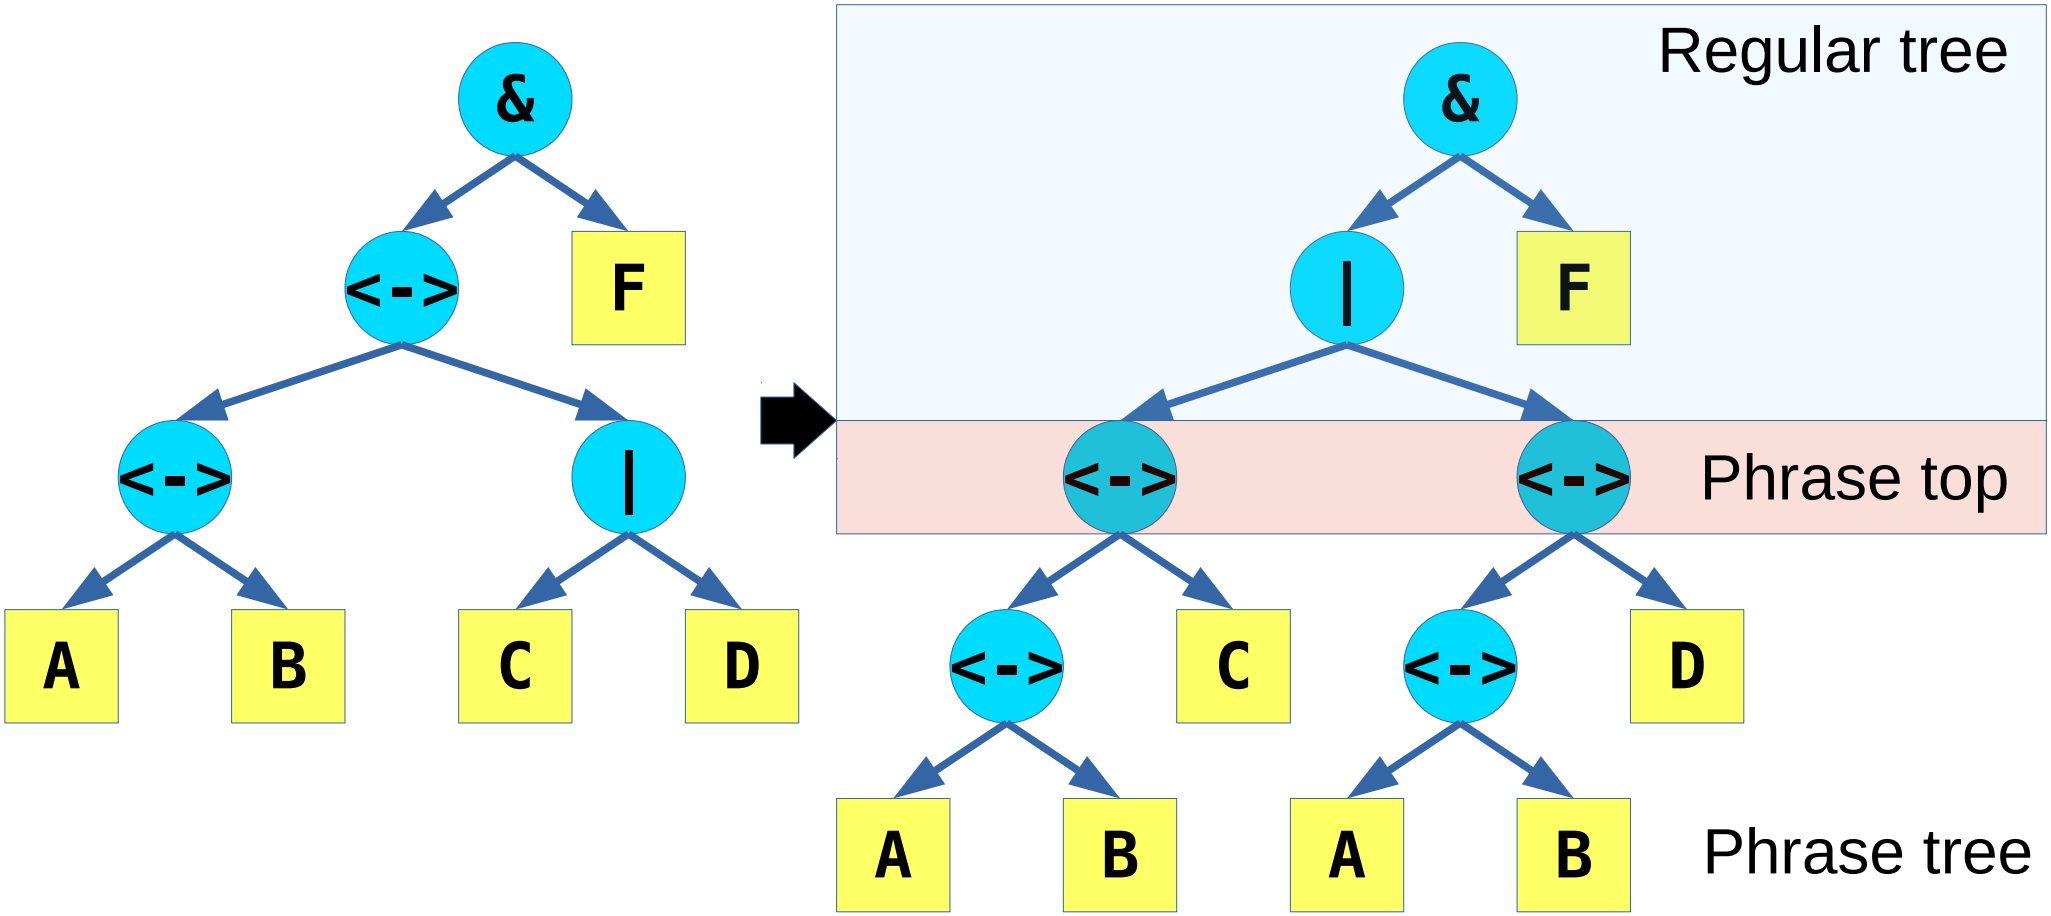
```
( (A <-> B) <-> (C | D) ) & F
```



- We want to avoid slowdown FTS operators (& |), which do not need positions.
- Rewrite query, so any <-> operators pushed down in query tree and call phrase executor for the top <-> operator.

Phrase search - transformation

```
( (A <-> B) <-> (C | D) ) & F
```



```
( 'A' <-> 'B' <-> 'C' | 'A' <-> 'B' <-> 'D' ) & 'F'
```

Phrase search - push down

```
a <-> (b&c) => a<->b & a<->c
(a&b) <-> c => a<->c & b<->c
a <-> (b|c) => a<->b | a<->c
(a|b) <-> c => a<->c | b<->c
a <-> !b    => a & !(a<->b)
```

there is no position of A followed by B

```
!a <-> b    => !(a<->b) & b
```

there is no position of B precedenced by A

Phrase search - transformation

```
# select '( A | B ) <-> ( D | C )'::tsquery;
                          tsquery
  ----------------------------------------
'A' <-> 'D' | 'B' <-> 'D' | 'A' <-> 'C' | 'B' <-> 'C'

# select 'A <-> ( B & ( C | ! D ) )'::tsquery;
                                tsquery
-------------------------------------------------------------
'A' <-> 'B' & ( 'A' <-> 'C' | 'A' & !( 'A' <-> 'D' ) )
```

Phrase search

1.1 mln postings (postgres mailing lists)

- Phrase search has overhead

```
select count(*) from pglist where fts @@ to_tsquery('english','tom <-> lane');
 count
--------
 222777
(1 row)
```

	<->(s)	& (s)	
Sequential Scan:	2.6	2.2	
GIN index:	1.1	0.48	- significant overhead
RUM index:	0.5	0.48	- solves the problem !

Some FTS problems: #3

- Slow FTS with ordering by timestamp («fresh» results)
  - Store timestamps in additional information in timestamp order !

```
create index pglist_fts_ts_order_rum_idx on pglist using
rum(fts rum_tsvector_timestamp_ops, sent) WITH (attach =
'sent', to ='fts', order_by_attach = 't');

select sent,  subject from pglist
where fts @@ to_tsquery('server & crashed')
order by sent <=| '2000-01-01'::timestamp limit 5;
```

  - Index Scan by RUM (fts, sent)
  - Limit
  - 0.08 ms vs 10 ms !

RUM vs GIN

- 6 mln classifies, real fts quieries, concurrency 24, duration 1 hour
  - GIN — 258087 qph
  - RUM — 1885698 qph (7x speedup)
- RUM has no pending list (not implemented) and stores more data.

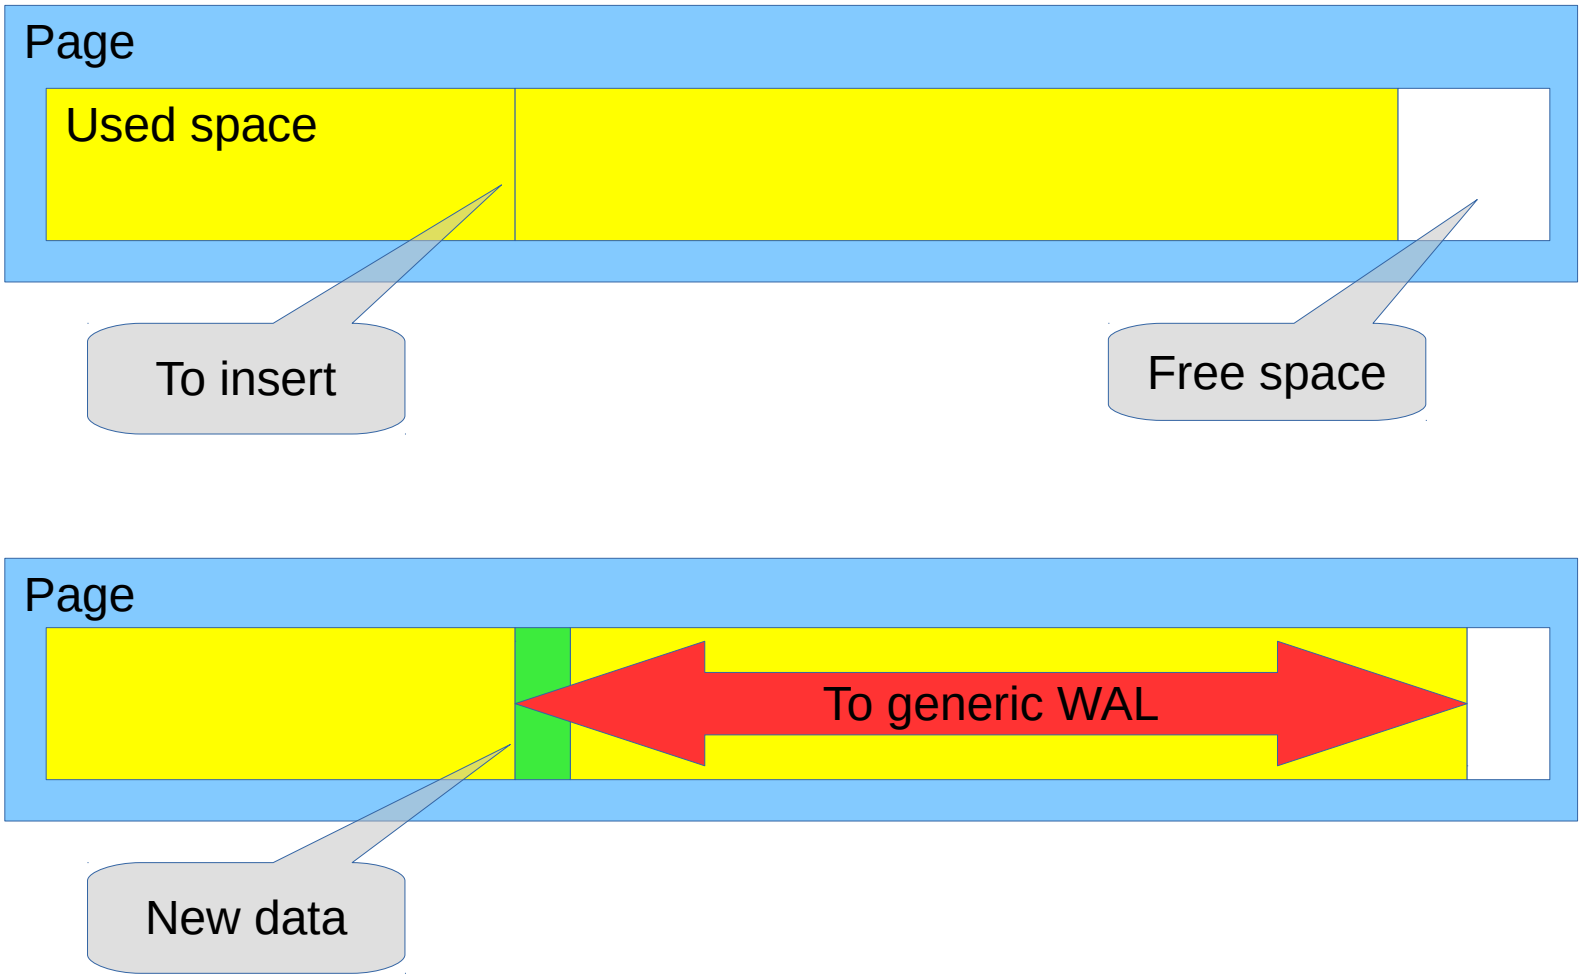
  Insert 1 mln messages shows no significant overhead:

  Time(min): `GiST(10), GIN(10), GIN_no_fast(21), RUM(34)`

  `WAL(GB): GiST(3.5), GIN(7.5), GIN_no_fast(24), RUM(29)`

RUM vs GIN

- CREATE INDEX
  - GENERIC WAL (9.6) generates too big WAL traffic



Inverse FTS (FQS)

- Find queries, which match given document
  - Automatic text classification

```
SELECT * FROM queries;
                 q                  |  tag
------------------------------------+-------
 'supernova' & 'star'               | sn
 'black'                            | color
 'big' & 'bang' & 'black' & 'hole'  | bang
 'spiral' & 'galaxi'                | shape
 'black' & 'hole'                   | color
(5 rows)

SELECT * FROM queries WHERE
 to_tsvector('black holes never exists before we think about them')
@@ q;
        q          |  tag
-------------------+-------
 'black'           | color
 'black' & 'hole'  | color
(2 rows)
```

Inverse FTS (FQS)

- RUM index supported – store branches of query tree in addinfo

Find queries for the first message in postgres mailing lists

```
\d pg_query
   Table "public.pg_query"
 Column |  Type   | Modifiers
--------+---------+-----------
 q      | tsquery |
 count  | integer |
Indexes:
    "pg_query_rum_idx" rum (q)                  33818 queries

select q from pg_query pgq, pglist where q @@ pglist.fts and pglist.id=1;

(5 rows))
```

RUM vs GIN

- CREATE INDEX
  - GENERIC WAL(9.6) generates too big WAL traffic.

    It currently doesn't supports shift.
    rum(fts, ts+order) generates 186 Gb of WAL !
  - RUM writes WAL AFTER creating index

table	gin	rum (fts	rum(fts,ts)	rum(fts,ts+order
Create time	147 s	201	209	215
Size(mb)	2167/1302	534	980	1531	1921
WAL (Gb)		0.9	0.68	1.1	1.5

RUM Todo

- Allow multiple additional info (lexemes positions + timestamp)
- Add support for arrays
- improve ranking function to support TF/IDF
- Improve insert time (pending list ?)
- Improve GENERIC WAL to support shift

Availability:

- 9.6+ only: https://github.com/postgrespro/rum

Better FTS configurability

- The problem
  - Search multilingual collection requires processing by several language-specific dictionaries. Currently, logic of processing is hidden from user and example would“nt works.

```
ALTER TEXT SEARCH CONFIGURATION multi_conf
    ALTER MAPPING FOR asciiword, asciihword, hword_asciipart,
    word, hword, hword_part
    WITH unaccent, german_ispell, english_ispell, simple;
```

- Logic of tokens processing in FTS configuration
  - Example: German-English collection

```
ALTER TEXT SEARCH CONFIGURATION multi_conf
    ALTER MAPPING FOR asciiword, asciihword, hword_asciipart,
    word, hword, hword_part
    WITH unaccent THEN (german_ispell AND english_ispell) OR simple;
```

Some FTS problems #4

- Working with dictionaries can be difficult and slow
  - Installing dictionaries can be complicated
  - Dictionaries are loaded into memory for every session (slow first query symptom) and eat memory.

```
time for i in {1..10}; do echo $i; psql postgres -c "select
ts_lexize('english_hunspell', 'evening')" > /dev/null;  done
1
2
3
4
5
6
7
8
9
10

real    0m0.656s
user    0m0.015s
sys 0m0.031s
```

For russian hunspell dictionary:

real 0m3.809s
user0m0.015s
sys 0m0.029s

Each session «eats» 20MB of RAM !

Dictionaries in shared memory

- Now it“s easy (Artur Zakirov, Postgres Professional + Thomas Vondra) https://github.com/postgrespro/shared_ispell

```
CREATE EXTENSION shared_ispell;
CREATE TEXT SEARCH DICTIONARY english_shared (
    TEMPLATE = shared_ispell,
    DictFile = en_us,
    AffFile = en_us,
    StopWords = english
);
CREATE TEXT SEARCH DICTIONARY russian_shared (
    TEMPLATE = shared_ispell,
    DictFile = ru_ru,
    AffFile = ru_ru,
    StopWords = russian
);
time for i in {1..10}; do echo $i; psql postgres -c "select ts_lexize('russian_shared', 'туши')" > /dev/null;  done
1
2
…..
10
```

```
real  0m0.170s
user  0m0.015s
sys   0m0.027s
```

VS

```
real 0m3.809s
user0m0.015s
sys  0m0.029s
```

Dictionaries as extensions

- Now it's easy (Artur Zakirov, Postgres Professional)
  https://github.com/postgrespro/hunspell_dicts

```
CREATE EXTENSION hunspell_ru_ru; -- creates russian_hunspell dictionary
CREATE EXTENSION hunspell_en_us; -- creates english_hunspell dictionary
CREATE EXTENSION hunspell_nn_no; -- creates norwegian_hunspell dictionary
SELECT ts_lexize('english_hunspell', 'evening');
   ts_lexize
----------------
 {evening,even}
(1 row)

Time: 57.612 ms
SELECT ts_lexize('russian_hunspell', 'туши');
       ts_lexize
------------------------
 {туша,тушь,тушить,туш}
(1 row)

Time: 382.221 ms
SELECT ts_lexize('norwegian_hunspell','fotballklubber');
          ts_lexize
-------------------------------
 {fotball,klubb,fot,ball,klubb}
(1 row)

Slow first query syndrom

Tsvector editing functions

- Stas Kelvich (Postgres Professional)
- setweight(tsvector, 'char', text[] - add label to lexemes from text[] array

```
select setweight( to_tsvector('english', '20-th anniversary of PostgreSQL'),
'A',  '{postgresql,20}');
                  setweight
-----------------------------------------------
 '20':1A 'anniversari':3 'postgresql':5A 'th':2
(1 row)
```

- ts_delete(tsvector, text[]) - delete lexemes from tsvector

```
select ts_delete( to_tsvector('english', '20-th anniversary of PostgreSQL'),
'{20,postgresql}'::text[]);
       ts_delete
------------------------
 'anniversari':3 'th':2
(1 row)
```

Tsvector editing functions

- unnest(tsvector)

```
select * from unnest( setweight( to_tsvector('english',
'20-th anniversary of PostgreSQL'),'A',  '{postgresql,20}'));
   lexeme    | positions | weights
-------------+-----------+---------
 20          | {1}       | {A}
 anniversari | {3}       | {D}
 postgresql  | {5}       | {A}
 th          | {2}       | {D}
(4 rows)
```

- tsvector_to_array(tsvector) — tsvector to text[] array
  array_to_tsvector(text[])

```
select tsvector_to_array( to_tsvector('english',
'20-th anniversary of PostgreSQL'));
       tsvector_to_array
-------------------------------
 {20,anniversari,postgresql,th}
(1 row)
```

Tsvector editing functions

- ts_filter(tsvector,text[]) - fetch lexemes with specific label{s}

```
select ts_filter($$'20':2A 'anniversari':4C 'postgresql':1A,6A 'th':3$$::tsvector,
'{C}');
    ts_filter
------------------
 'anniversari':4C
(1 row)

select ts_filter($$'20':2A 'anniversari':4C 'postgresql':1A,6A 'th':3$$::tsvector,
'{C,A}');
                   ts_filter
-----------------------------------------------
 '20':2A 'anniversari':4C 'postgresql':1A,6A
(1 row)
```

FTS demo

- How to configure and use FTS with PostgreSQL?

  https://github.com/select-artur/apod_fts

  ToDo:
- Exampe of fixing misspelled user queries
- Query suggestion for user

Thanks !
